

Protecting Your Microsoft Office 365 OneDrive and SharePoint Data

Question: I'm now using Microsoft Office 365 OneDrive and SharePoint Online to store my files and collaborate within my team. Do I still need Dr. Backup protection?

Answer: Yes. Dr. Backup service is SUPER critical to those that depend on cloud-based storage and tools. Here's why...

Once critical data is outside of your physical control, **it's a viable target for every cybercriminal in the world** – including those far outside the jurisdiction of US law enforcement agencies. This factor alone increases your risk exposure exponentially.

If ANY of your Office 365 accounts are compromised, **all your shared online files are in jeopardy**. Massive data loss can be caused by a single careless or disgruntled employee!

While Office 365 has some capability to recover lost/deleted files, it's far from being a "fail-safe" backup. Without Dr. Backup, you may not be able to **recover files older than 30 days!**

Storage of data in the cloud, does **not relieve you of compliance and regulatory responsibilities**. Regulations – including those from FINRA and HIPAA -- must still be followed. Business Associate Agreements must now be executed with Microsoft.

Microsoft explicitly writes in their online services agreement: Section 6. Service Availability – **"We recommend that you regularly backup Your Content and Data that you store on the Services..."** These carefully chosen words limit their liability in the event of a service issue. In other words, **YOU HAVE BEEN WARNED!**

The Dr. Backup service has been enhanced to help clients protect their data – whether it lives on customer-owned equipment – **or is stored in the Microsoft cloud.**

Our cloud backup service protects your local files, folders, SQL Databases, email archives, application specific data, NAS devices **and document libraries stored online in OneDrive or SharePoint (Microsoft Office 365).**

Not only does Dr. Backup provide technology, we also include in all our service packages the expertise needed to Setup, Monitor, Alert, Restore and Test (S.M.A.R.T.) your backup solution. **This service is NOT included with Office 365 or Microsoft Windows.**

Bottom Line: You alone are responsible for backing up your Microsoft OneDrive and SharePoint Online data – NOT Microsoft. As always, **Dr. Backup is here to help!**
